

Data Integration

Data Integration is an innovative new software tool, which simplifies the process of extracting information from data. Some of the key features include:

- Extract data from any database or file
- Integrate data from multiple disparate sources

- Find and handle duplicate records
- Visually create filters to extract data

- Aggregate (create counts, sums, means, etc)
- Customize output in many formats
- Automate, streamline and standardize reporting across multiple institutions

- Gain more trust in reports with the ability to visually trace the data through any transformations, aggregations, and cleansing, back to the originating source

- Get the right data, to the right people, at the right time, to make the right decisions

- Empower users to learn and explore data without programming

Here at Rapid Insight, we've developed a technology that lets institutions ask endless questions of their data, quickly and efficiently, without the need for custom programming. Rapid Insight® Data Integration makes it easy to turn data into actionable knowledge with the ability to create visual drag-and-drop processes.
